Assignment 1: Dataset Curation

Due: April the 12th at 11:59

Find 21 sounds in Freesound (3 per person). Each sound must be at least one minute long. Trim each sound so that they are exactly one minute long.

For each sound, report its timbral characteristics and ensure that all selected sounds are sufficiently distinct from one another. To validate this, you must verify that their CLAP embeddings form well-separated clusters in the CLAP manifold.

Use the notebook titled `"Task 2. CLAP + Dimensionality Reduction.ipynb"`, which was studied in class, to perform this analysis properly.

Finally, report your findings in your designated folder within the *Assignment Reports* directory of our group Google Drive.
